

Package: GenomicTools.fileHandler (via r-universe)

October 25, 2024

Type Package

Title File Handlers for Genomic Data Analysis

Version 0.2.2

Date 2024-02-28

Author Daniel Fischer

Maintainer Daniel Fischer <daniel.fischer@luke.fi>

Description A collection of I/O tools for handling the most commonly used genomic datafiles, like fasta/-q, bed, gff, gtf, ped/map and vcf.

Depends R (>= 3.3), data.table (>= 1.9.6)

Imports snpStats

Suggests knitr, rmarkdown

VignetteBuilder knitr

License GPL (>= 2)

Encoding UTF-8

LazyLoad yes

RoxygenNote 7.1.2

Repository <https://fischuu.r-universe.dev>

GenomicTools.fileHandler-package

R Package To Handle Files From Genomic Data Genomic-Tools.fileHandler is a loose collection of I/O Functions Needed in Genomic Data Analysis

Description

Package: GenomicTools.fileHandler
Type: Package
Version: 0.2
Date: 2024-01-16
License: GPL
LazyLoad: yes

Author(s)

Daniel Fischer

Maintainer: Daniel Fischer <daniel.fischer@luke.fi>

example.bed

Example Gene Annotation in Bed-Format

Description

This file contains some example lines to represent a typical bed file that can be used to try the corresponding functions.

Format

A file with three column Chr, Start and End.

Details

The file is located in the /extdata folder of the package and is accessible after installation via `system.file("extdata", "example.bed", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

`example.fasta`*Example Sequencing Reads in fasta-Format*

Description

This file contains some example reads to represent a typical fasta file that can be used to try the corresponding functions.

Details

The file is located in the `/extdata` folder of the package and is accessible after installation via `system.file("extdata", "example.fasta", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

`example.fastq`*Example Sequencing Reads in fastq-Format*

Description

This file contains some example reads to represent a typical fastq file that can be used to try the corresponding functions.

Details

The file is located in the `/extdata` folder of the package and is accessible after installation via `system.file("extdata", "example.fastq", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

`example.gff`*Example Gene Annotation in gff-Format*

Description

This file contains some example gene annotations to represent a typical gff file that can be used to try the corresponding functions.

Details

The file is located in the `/extdata` folder of the package and is accessible after installation via `system.file("extdata", "example.gff", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

`example.gtf`*Example Gene Annotation in gtf-Format*

Description

This file contains some example gene annotations to represent a typical gtf file that can be used to try the corresponding functions.

Details

The file is located in the `/extdata` folder of the package and is accessible after installation via `system.file("extdata", "example.gtf", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

example.ped

Example Variant data in ped/map-Format

Description

This file contains some example variants to represent a typical ped/map file pair that can be used to try the corresponding functions.

Details

The file is located in the /extdata folder of the package and is accessible after installation via `system.file("extdata", "example.ped", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

example.vcf

Example Variant data in vcf-Format

Description

This file contains some example variants to represent a typical vcf file that can be used to try the corresponding functions.

Details

The file is located in the /extdata folder of the package and is accessible after installation via `system.file("extdata", "example.vcf", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

`example2.gtf.gz`*Example Gene Annotation in zipped gtf-Format*

Description

This file contains some example gene annotations to represent a typical zipped gtf file that can be used to try the corresponding functions.

Details

The file is located in the `/extdata` folder of the package and is accessible after installation via `system.file("extdata", "example2.gtf.gz", package="GenomicTools.fileHandler")`

Author(s)

Daniel Fischer

`exportBed`*Exporting a Bed File.*

Description

This function exports a standard bed file.

Usage

```
exportBed(x, file = NULL, header = FALSE)
```

Arguments

| | |
|---------------------|------------------------------------|
| <code>x</code> | data.frame |
| <code>file</code> | Character, specifies filename/path |
| <code>header</code> | Logical, shall a header be written |

Details

This function exports a data.frame to a standard bed file. If no file name is given, the variable name will be used instead.

Value

A bed file

Author(s)

Daniel Fischer

Examples

```
novelBed <- data.frame(Chr=c(11,18,3),
                      Start=c(72554673, 62550696, 18148822),
                      End=c(72555273, 62551296, 18149422),
                      Gene=c("LOC1", "LOC2", "LOC3"))

# Create a temporary file to where the output of the function is stored
myfile <- file.path(tempdir(), "myLocs.bed")

exportBed(novelBed, file=myfile)
exportBed(novelBed, file=myfile, header=TRUE)
```

exportFA

Exporting a Fasta File.

Description

This function exports a standard fasta file.

Usage

```
exportFA(fa, file = NULL)
```

Arguments

| | |
|------|------------------------------------|
| fa | fasta object |
| file | Character, specifies filename/path |

Details

This function exports a fasta object to a standard fasta file. If no file name is given, the variable name will be used instead.

Value

A fasta file

Author(s)

Daniel Fischer

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata","example.fasta", package="GenomicTools.fileHandler")
# Import the example fasta file
fastaFile <- importFA(file=fpath)
newFasta <- fastaFile[1:5]

myfile <- file.path(tempdir(), "myLocs.fa")

exportFA(newFasta, file=myfile)
```

exportGTF

Exporting a GTF File.

Description

This function exports a standard gtf file.

Usage

```
exportGTF(x, file)
```

Arguments

| | |
|------|------------------------------------|
| x | gtf-object |
| file | Character, specifies filename/path |

Details

This function exports a gtf-object to a standard gtf file.

Value

A gtf file

Author(s)

Daniel Fischer

`importBed`*Importing a Bed File.*

Description

This function imports a standard bed file

Usage

```
importBed(file, header = FALSE, sep = "\t")
```

Arguments

| | |
|---------------------|------------------------------|
| <code>file</code> | Specifies the filename/path |
| <code>header</code> | Logical, is a header present |
| <code>sep</code> | Column separator |

Details

This function imports a standard bed-file into a `data.frame`. It is basically a convenience wrapper around `read.table`. However, if no header lines is given, this function automatically assigns the column names, as they are given in the bed-specification on the Ensembl page here: <https://www.ensembl.org/info/website/upload/bed.html>

Value

A `data.frame`

Author(s)

Daniel Fischer

See Also

[`exportBed`], [`read.table`]

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata", "example.bed", package="GenomicTools.fileHandler")
# Import the example bed file
bedFile <- importBed(file=fpath)
```

| | |
|----------------|---|
| importBlastTab | <i>Import a Tab Delimited Blast Output File</i> |
|----------------|---|

Description

This function imports a tab delimited blast output.

Usage

```
importBlastTab(file)
```

Arguments

| | |
|------|----------|
| file | Filename |
|------|----------|

Details

This function imports a tab delimited blast output file, currently the same as read.table

Value

A data.frame

Author(s)

Daniel Fischer

| | |
|----------|--------------------------------|
| importFA | <i>Importing a Fasta File.</i> |
|----------|--------------------------------|

Description

This function imports a standard fasta file

Usage

```
importFA(file, verbose = FALSE)
```

Arguments

| | |
|---------|----------------------------------|
| file | Specifies the filename/path |
| verbose | Logical, verbose function output |

Details

This function imports a standard fasta file. Hereby, it does not matter if the identifier and sequence are alternating or not, as the rows starting with '>' are used as identifier.

The example file was downloaded from here and was then further truncated respective transformed to fasta format:

`ftp://ftp.1000genomes.ebi.ac.uk/vol1/ftp/phase3/data/HG00096/sequence_read/`

Value

An object of class `fa` containing the sequences. The names correspond to the sequence names given in the fasta file.

Author(s)

Daniel Fischer

See Also

`print.fa`, `summary.fa`

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata", "example.fasta", package="GenomicTools.fileHandler")
# Import the example fasta file
fastaFile <- importFA(file=fpath)
```

`importFeatureCounts` *Import from FeatureCounts*

Description

This functions imports the output from `FeatureCounts`

Usage

```
importFeatureCounts(file, skip = 0, headerLine = 2)
```

Arguments

| | |
|-------------------------|---|
| <code>file</code> | Character, file name |
| <code>skip</code> | Number of lines to skip from txt file |
| <code>headerLine</code> | Linenumber that contains the header information |

Details

FeatureCounts produces two files, the txt that contain the expression values and then the summary that contains all the information about the mapping statistics. This function imports both and stores them in a corresponding list.

Value

A list with expValues, geneInfo and summary

Author(s)

Daniel Fischer

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata", "featureCountsExample.txt", package="GenomicTools.fileHandler")
# Import the example featureCounts file
fcFile <- importFeatureCounts(file=fpath)
```

importFQ

Importing a Fastq File.

Description

This function imports a standard fastq file

Usage

```
importFQ(file)
```

Arguments

file Specifies the filename/path

Details

This function imports a standard fastq file that consists out of blocks of four lines per entry

Value

An object of class fq containing the sequences and the quality measure. The names correspond to the sequence names given in the fasta file.

Author(s)

Daniel Fischer

See Also

print.fq, summary.fq

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata", "example.fastq", package="GenomicTools.fileHandler")
# Import the example fastq file
fastqFile <- importFQ(file=fpath)
```

importGFF

importGFF

Description

Import a GFF file

Usage

```
importGFF(
  file,
  skip = "auto",
  nrow = -1,
  use.data.table = TRUE,
  level = "gene",
  features = NULL,
  num.features = c("FPKM", "TPM"),
  print.features = FALSE,
  merge.feature = NULL,
  merge.all = TRUE,
  class.names = NULL,
  verbose = TRUE
)
```

Arguments

| | |
|----------------|--|
| file | file or folder |
| skip | numeric, lines to skip |
| nrow | numeric, lines to read |
| use.data.table | logical |
| level | Character, read level, default: "gene" |
| features | features to import |
| num.features | names of the numeric features |
| print.features | Logical, print available features |

| | |
|----------------------------|---|
| <code>merge.feature</code> | Character, merge multiple samples to dataset |
| <code>merge.all</code> | Logical, shall all samples be merged together |
| <code>class.names</code> | Definition of class name sin V9 |
| <code>verbose</code> | Logical, verbose function output |

Details

This function imports a standard gff file.

Value

A gff object

Author(s)

Daniel Fischer

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata","example.gff", package="GenomicTools.fileHandler")
# Import the example gff file
importGFF(fpath)
```

`importGFF3`*importGFF3*

Description

Import a GFF3 file

Usage

```
importGFF3(gff, chromosomes)
```

Arguments

| | |
|--------------------------|--------------------------|
| <code>gff</code> | file or folder |
| <code>chromosomes</code> | The chromosome to import |

Details

This function imports a standard gff3 file.

Value

A gff object

Author(s)

Daniel Fischer

`importGTF`*Import a GTF File*

Description

This function imports a gtf file.

Usage

```
importGTF(  
  file,  
  skip = "auto",  
  nrow = -1,  
  use.data.table = TRUE,  
  level = "gene",  
  features = NULL,  
  num.features = c("FPKM", "TPM"),  
  print.features = FALSE,  
  merge.feature = NULL,  
  merge.all = TRUE,  
  class.names = NULL,  
  verbose = TRUE  
)
```

Arguments

| | |
|-----------------------------|--|
| <code>file</code> | file or folder |
| <code>skip</code> | numeric, lines to skip |
| <code>nrow</code> | numeric, lines to read |
| <code>use.data.table</code> | logical |
| <code>level</code> | Character, read level, default: "gene" |
| <code>features</code> | features to import |
| <code>num.features</code> | names of the numeric features |
| <code>print.features</code> | Logical, print available features |
| <code>merge.feature</code> | Character, merge multiple samples to dataset |
| <code>merge.all</code> | Logical, shall all samples be merged |
| <code>class.names</code> | Vector with class names |
| <code>verbose</code> | Logical, verbose function output |

Details

This function imports a gtf file. The features names to be imported are defined in `features`, several features are then provided as vector. A list of available feature can be printed, by setting `print.features=TRUE`.

The `skip` option allows to skip a given number of rows, the default is, however, `auto`. In that case, all rows that start with the `#` symbol are skipped.

In case a set of expression values given in gtf format should be imported and to be merged into a single data table, the feature that should be used for merging can be provided to the `merge.feature` option. In that case the function expects a folder in `file` and it will import all gtf files located in that folder and merges them according to the `merge.feature` option. With the option `class.names` a vector of prefixes for the merged features can be provided. If this is kept empty, then the filenames of the gtf will be used instead (without gtf extension).

By default the function imports all features in column 9 as string character. However, for common labels (FPKM and TPM) the class type is set automatically to numeric. Additional numerical feature names can be defined with the `num.feature` option.

Value

A gtf object

Author(s)

Daniel Fischer

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata","example.gtf", package="GenomicTools.fileHandler")
# Same file, but this time as gzipped version
fpath.gz <- system.file("extdata","example2.gtf.gz", package="GenomicTools.fileHandler")

# Import the example gtf file
importGTF(fpath, level="transcript", features=c("gene_id","FPKM"))

## Not run:
# For the current you need to have zcat installed (should be standard on a Linux system)
importGTF(fpath.gz, level="transcript", features=c("gene_id","FPKM"))

## End(Not run)
```

importPED

importPED

Description

Import a PED/MAP file pair

Usage

```
importPED(
  file,
  n,
  snps = NULL,
  which,
  split = "\\t| +",
  sep = ".",
  na.strings = "0",
  lex.order = FALSE,
  verbose = TRUE
)
```

Arguments

| | |
|------------|----------------------------------|
| file | ped filename |
| n | Number of samples to read |
| snps | map filename |
| which | Names of SNPS to import |
| split | Columns separator in ped file |
| sep | Character that separates Alleles |
| na.strings | Definition for missing values |
| lex.order | Logical, lexicographical order |
| verbose | Logical, verbose output |

Details

This function is to a large extent taken from `snpStat::read.pedmap`, but here is internally the `data.table::fread` function used that resulted in much faster file processing.

To import the data, the ped file can be provided to the `file` option and the map file to the `snps` option. If no option is given to `snps` and the `file` option is provided without any file extension, then the `ped/map` extension are automaticall added

Value

a pedmap object

Author(s)

Daniel Fischer

Examples

```
# Define here the location on HDD for the example file
pedPath <- system.file("extdata","example.ped", package="GenomicTools.fileHandler")
mapPath <- system.file("extdata","example.map", package="GenomicTools.fileHandler")
# Import the example ped/map files
```

```
importPED(file=pedPath, snps=mapPath)
```

```
importSTARLog
```

```
importSTARLog
```

Description

Import the Log-File from STAR

Usage

```
importSTARLog(  
  dir,  
  recursive = TRUE,  
  log = FALSE,  
  finalLog = TRUE,  
  verbose = TRUE  
)
```

Arguments

| | |
|-----------|--------------------------------------|
| dir | The directory name |
| recursive | Logical, check for sub-directories |
| log | boolean, import also log file |
| finalLog | boolean, import also final_log file |
| verbose | Logical, talkative function feedback |

Details

This function imports the Log file from STAR

Value

a data frame

Author(s)

Daniel Fischer

`importVCF`*importVCF*

Description

Import a VCF function

Usage

```
importVCF(  
  file,  
  na.seq = "./.",  
  simplify = TRUE,  
  getInfo = FALSE,  
  formatFields = NULL  
)
```

Arguments

| | |
|---------------------------|------------------------------|
| <code>file</code> | The file name |
| <code>na.seq</code> | The missing value definition |
| <code>simplify</code> | Logical |
| <code>getInfo</code> | Logical |
| <code>formatFields</code> | Vector with names |

Details

This function imports a VCF file.

In case the logicl flag 'phased' is set to TRUE then the genotypes are expected to be in the format 0/0, otherwise they are expected to be like 0/1 . If the flag simplify is set genotypes like 0/2 or 1/2 will be set to 0,1,2 coding and multi-alternatives are ignored.

If you would like to extract in addition to the genotype information further any other data from th vcf file formatted in the FORMAT field, you can specify their names in the formatFields option. Currently, it only accepts a single value.

The example file was downloaded from here:

ftp://ftp.1000genomes.ebi.ac.uk/vol1/ftp/pilot_data/release/2010_07/exon/snps/

Value

A vcf object

Author(s)

Daniel Fischer

Examples

```
# Define here the location on HDD for the example file
fpath <- system.file("extdata","example.vcf", package="GenomicTools.fileHandler")
# Import the example vcf file
importVCF(fpath)
```

importXML

importXML

Description

Import an Blast XML file

Usage

```
importXML(folder, seqNames = NULL, which = NULL, idTH = 0.8, verbose = TRUE)
```

Arguments

| | |
|----------|------------------------------|
| folder | Character, folder path |
| seqNames | Names of sequences |
| which | Which sequences to import |
| idTH | Use the threshold as cut-off |
| verbose | Logical, verbose output |

Details

This function imports XML files as provided as Blast output, it is mainly aimed to import the output of the hoardeR package

Value

An XML object

Author(s)

Daniel Fischer

| | |
|-----------------------------|-----------------------|
| <code>plotTotalReads</code> | <i>plotTotalReads</i> |
|-----------------------------|-----------------------|

Description

Plot the total reads

Usage

```
plotTotalReads(STARLog)
```

Arguments

| | |
|---------|------------------|
| STARLog | A STARLog object |
|---------|------------------|

Details

This function plots the total reads from a STARlog object

Part of the diagnostic plot series for of the STARLog. The function accepts also a list of STARLogs and creates then comparative boxplots

Value

A plot

Author(s)

Daniel Fischer

| | |
|--------------------------------------|--------------------------------|
| <code>plotUniquelyMappedReads</code> | <i>plotUniquelyMappedReads</i> |
|--------------------------------------|--------------------------------|

Description

Plot the uniquely mapped reads

Usage

```
plotUniquelyMappedReads(STARLog)
```

Arguments

| | |
|---------|------------------|
| STARLog | A STARLog object |
|---------|------------------|

Details

This function plots the percentage of uniquely reads from a STARlog object

Part of the diagnostic plot series for of the STARLog. The function accepts also a list of STARLogs and creates then comparative boxplots

Value

A plot

Author(s)

Daniel Fischer

```
prereadGTF
```

```
prereadGTF
```

Description

Preread a gtf file and prints features of it for importing it.

Usage

```
prereadGTF(file, nrow = 1000, skip = "auto")
```

Arguments

| | |
|------|------------------------|
| file | Filename |
| nrow | Number of rows to read |
| skip | Rows to skip from top |

Details

This function reads in a gtf file and prints its features for the import step.

By default this function only imports the first 1000 rows, in case all rows should be imported set nrow=-1.

The number to skip in the beginning can be adjusted by the skip option. The default is here auto so that the function can identify the correct amount of header rows. Hence, this option should be changed only, if there is a good reason.

Value

A list of available features

Author(s)

Daniel Fischer

print.bed *Print a bed Object*

Description

Prints a bed object.

Usage

```
## S3 method for class 'bed'  
print(x, n = 6, ...)
```

Arguments

| | |
|-----|--------------------------|
| x | Object of class bed. |
| n | Number of lines to print |
| ... | Additional parameters |

Details

The print function displays a bed object

Author(s)

Daniel Fischer

print.fa *Print a fa Object*

Description

Prints a fa object.

Usage

```
## S3 method for class 'fa'  
print(x, n = 2, seq.out = 50, ...)
```

Arguments

| | |
|---------|--------------------------------------|
| x | Object of class fa. |
| n | Number of sequences to display |
| seq.out | Length of the subsequence to display |
| ... | Additional parameters |

Details

The print function displays a fa object

Author(s)

Daniel Fischer

`print.featureCounts` *Print a featureCounts Object*

Description

Prints an featureCounts object.

Usage

```
## S3 method for class 'featureCounts'  
print(x, ...)
```

Arguments

| | |
|------------------|--------------------------------|
| <code>x</code> | Object of class featureCounts. |
| <code>...</code> | Additional parameters |

Details

The print function displays a featureCounts object

Author(s)

Daniel Fischer

`print.fq` *Print a fq Object*

Description

Prints a fq object.

Usage

```
## S3 method for class 'fq'  
print(x, n = 2, seq.out = 50, print.qual = TRUE, ...)
```

Arguments

| | |
|------------|---|
| x | Object of class fq. |
| n | Number of sequences to display |
| seq.out | Length of the subsequence to display |
| print.qual | Logical, shall the quality measures also be printed |
| ... | Additional parameters |

Details

The print function displays a fa object

Author(s)

Daniel Fischer

| | |
|------------------------|---------------------------|
| <code>print.gtf</code> | <i>Print a gtf Object</i> |
|------------------------|---------------------------|

Description

Prints a gtf object.

Usage

```
## S3 method for class 'gtf'
print(x, n = 6, ...)
```

Arguments

| | |
|-----|--------------------------|
| x | Object of class gtf. |
| n | Number of lines to print |
| ... | Additional parameters |

Details

The print function displays a bed object

Author(s)

Daniel Fischer

print.pedMap *Print a pedMap Object*

Description

Prints an pedMap object.

Usage

```
## S3 method for class 'pedMap'  
print(x, n = 6, m = 6, ...)
```

Arguments

| | |
|-----|------------------------------|
| x | Object of class pedMap. |
| n | Number of samples to display |
| m | Number of columns to display |
| ... | Additional parameters |

Details

The print function displays a pedMap object

Author(s)

Daniel Fischer

print.vcf *Print a vcf Object*

Description

Prints an vcf object.

Usage

```
## S3 method for class 'vcf'  
print(x, n = 6, m = 6, fullHeader = FALSE, ...)
```

Arguments

| | |
|------------|--|
| x | Object of class vcf. |
| n | Number of samples to display |
| m | Number of columns to display |
| fullHeader | Logical, shall the whole header be printed |
| ... | Additional parameters |

Details

The print function displays a vcf object

Author(s)

Daniel Fischer

| | |
|-------------|--------------------------------|
| summary.bed | <i>Summary of a bed Object</i> |
|-------------|--------------------------------|

Description

Summarizes a bed object.

Usage

```
## S3 method for class 'bed'  
summary(object, ...)
```

Arguments

| | |
|--------|-----------------------|
| object | Object of class bed. |
| ... | Additional parameters |

Details

The summary function displays an informative summary of a bed object

Author(s)

Daniel Fischer

| | |
|------------|-------------------------------|
| summary.fa | <i>Summary of a fa Object</i> |
|------------|-------------------------------|

Description

Summarizes a fa object.

Usage

```
## S3 method for class 'fa'  
summary(object, ...)
```

Arguments

| | |
|--------|-----------------------|
| object | Object of class fa. |
| ... | Additional parameters |

Details

The summary function displays an informative summary of a fa object

Author(s)

Daniel Fischer

summary.featureCounts *Summary of a featureCounts Object*

Description

Summarizes a featureCounts object.

Usage

```
## S3 method for class 'featureCounts'  
summary(object, ...)
```

Arguments

| | |
|--------|--------------------------------|
| object | Object of class featureCounts. |
| ... | Additional parameters |

Details

The summary function displays an informative summary of a featureCounts object

Author(s)

Daniel Fischer

summary.fq

Summary of a fq Object

Description

Summarizes a fq object.

Usage

```
## S3 method for class 'fq'  
summary(object, ...)
```

Arguments

| | |
|--------|-----------------------|
| object | Object of class fq. |
| ... | Additional parameters |

Details

The summary function displays an informative summary of a fq object

Author(s)

Daniel Fischer

summary.gtf

Summary of a gtf Object

Description

Summarizes a gtf object.

Usage

```
## S3 method for class 'gtf'  
summary(object, ...)
```

Arguments

| | |
|--------|-----------------------|
| object | Object of class gtf. |
| ... | Additional parameters |

Details

The summary function displays an informative summary of a gtf object

Author(s)

Daniel Fischer

summary.STARLog *Summary of a STARLog Object*

Description

Summarizes a STARLog object.

Usage

```
## S3 method for class 'STARLog'  
summary(object, ...)
```

Arguments

| | |
|--------|--------------------------|
| object | Object of class STARLog. |
| ... | Additional parameters |

Details

The summary function displays an informative summary of a STARLog object

Author(s)

Daniel Fischer
